

# A neural network model for detecting intrusions or attacks on a computer network

Steven Smith

P13167208

Wednesday 11<sup>th</sup> May - 3pm

# What is to come?

- Overview of the problem
- The training data
- The data transformation techniques used
- The method of construction
- The experiments
- The results

# Network Intrusion Detection

- Network Security of great importance
  - Our lives are in the web
  - Risks – Litigation, Financial, Injury or Death
  - Hacked systems regularly reported in the press
- Network Intrusion Detection Systems
  - Good/Normal Connections
  - Bad/Attacking Connections

# Neural Network based Intrusion Detection

- Supervised neural network to classify network activity
- Neural Network configuration
  - Difficult to determine ideal parameters
  - Trial and error
- Progress in evolutionary approaches
  - Particle swarm optimisation
  - Genetic algorithms

# KDD Cup 1999 Data

- The Third International Knowledge Discovery and Data Mining Tools Competition
  - Build predictive model determine bad vs good connections
  - intrusions simulated in a military network environment
- CSV containing 10% of the data
  - 494021 rows
  - 41 Dimension
  - 23 classifications

# More about the data

- 38 of 41 dimensions contain numeric data
  - 32 are Interval, Continuous
  - 6 are Discrete, 0 or 1
- 3 of 41 dimensions contain nominal data
  - Protocol\_type, service, flag
- Result contains nominal data
  - 23 classes including normal and smurf.

# Data Transformation

- 4 nominal columns
  - Lookup script (“if then else” mapping to ordinal value)
- Matlab data transformation functions
  - Each dimension treated equally
  - Mapminmax
  - Mapstd
  - RemoveConstantRows
  - PerformPCA

# More Data Transformation

- Result column converted from single value to array
  - number 3 would be represented by  
[0, 0, 1, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0]
- Maintain distribution in training datasets
  - $280790/494021 \approx 57\%$  - 'smurf' attacks
  - $97278/494021 \approx 20\%$  - 'normal' usage
- New generated smaller dataset
  - $\approx 5700/10000 \approx 57\%$  - 'smurf' attacks
  - $\approx 2000/10000 \approx 20\%$  - 'normal' usage
  - First x rows of the classification

# Method of construction

- Limited time, too many combinations
  - Limited set of perturbable parameters
- Nprtool – Pattern recognition tool
  - ‘patternnet’ defaults
  - ‘trainscg’ - Scaled conjugate gradient BP
  - ‘crossentropy’ - performance
  - ‘softmax’ – output activation function
  - Random subsampling cross validation (10/90)

# Parameters tested

- Network topology, hidden layers, number of neurons in each layer
- The size of the training and validation dataset.
- The normalizing functions - mapminmax and mapstd
- Principal Component analysis - on or off
- Training vs Validation sizes (10/90, 50/50, 90/10, 30/70, 70/30)
- Maximum number of epochs - 100 or 250
- The hidden layer activation functions - 15 functions (compet, elliotssig, hardlim, hardlims, logsig, netinv, poslin, purelin, radbas, radbasn, satlin, satlins, softmax, tansig, tribas).
- Number of folds for random subsampling
  - 10
  - maximum of 100 whilst performance continues to improve.

# Experiments 1-9

- Test a combination of parameters
  - Aim to reduce options down to a single choice
  - 15 activation functions down to 1
  - 2 normalizing functions down to 1
- Generates a table of data
- Ranking results
  - Percentage Error
  - Cross Entropy Performance

# Experiments 10 - 14

- Mapminmax, no PCA
- Activation function – radbas
- 5 Topologies
  - [35 35]; [20 20 20 20]; [20 20 20]; [15 15 15 15]; 20
- 5 training vs validation splits
  - 10/90, 50/50, 90/10, 30/70, 70/30
- maximum of 100 folds whilst performance continues to improve

# Final Results Table

<i>Hidden Layers/Neurons</i>	<i>Train/Val Ratio</i>	<i>Performance</i>	<i>% Error</i>	<i>No. of Errors</i>	<i>No. of Network Connections</i>
35 × 35	30/70	0.000238848	0.007847845	3877	3395
20 × 20 × 20 × 20	30/70	0.000248808	0.007949055	3927	2440
20 × 20 × 20	30/70	0.00024774	0.008113015	4008	2040
20 × 20 × 20	70/30	0.000256067	0.008244589	4073	2040
20	10/90	0.000251437	0.008291146	4096	1240

Table 2: The best performing Neural Networks (top 5 rows)

# The chosen neural network

- 'patternnet' defaults
- 39×20×23 using radbas and softmax
- Trainscg - scaled conjugate gradient BP
- removeconstantrows, mapminmax
- training/validation ratio of 10/90
- 96.3% accuracy classifying normal connections
- 99% accuracy classifying bad connections.

Any questions?
